What to Expect from This Module

Challenges in our current implementation

Understanding Model-View-ViewModel

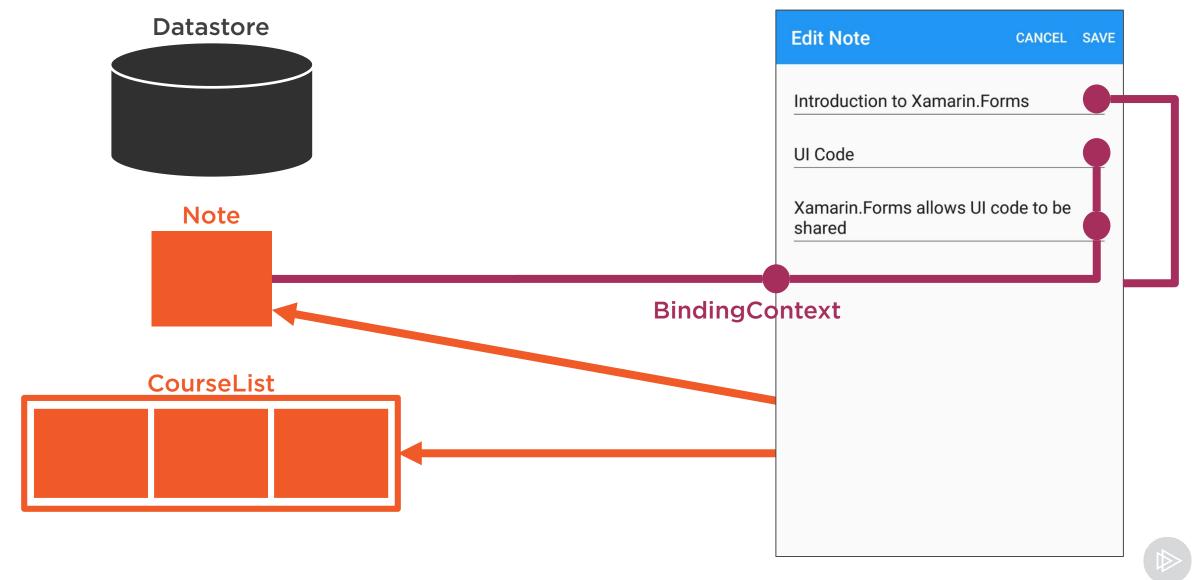

Migrating to Model-View-ViewModel

BaseViewModel class

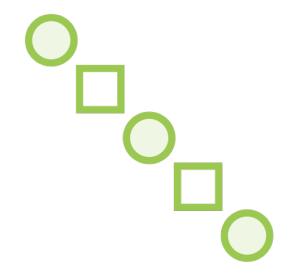

Property change notifications

Our App's Current Implementation

Model-View-ViewModel (MVVM)

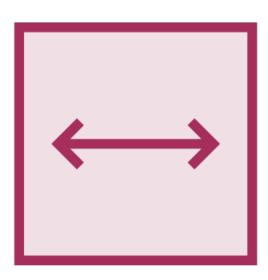

Decouples data from presentation

Presentation and data unaware of the other's details

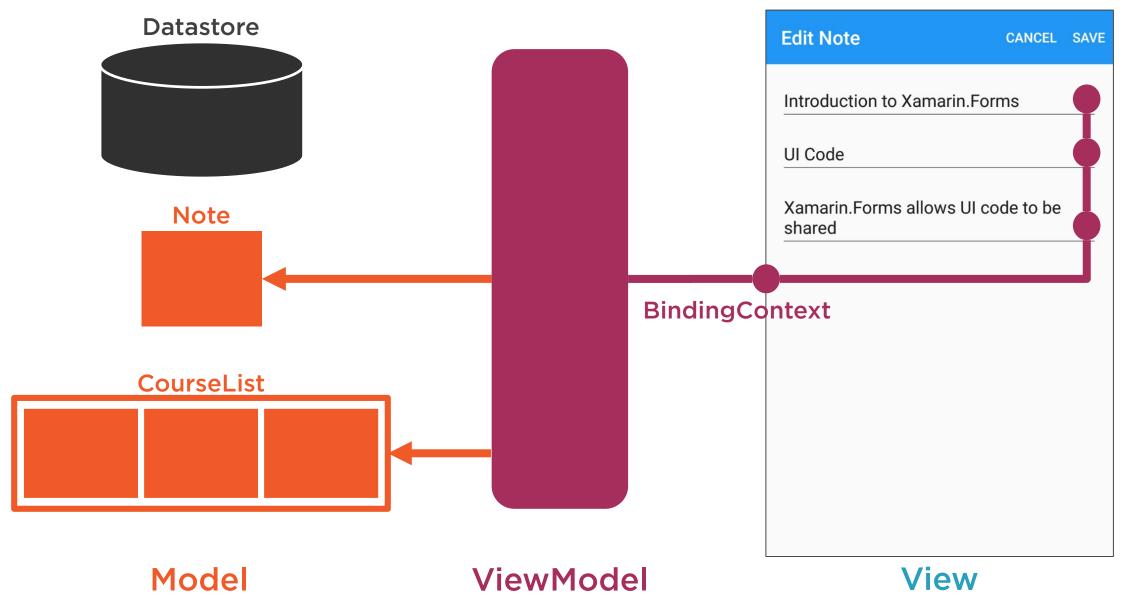

Adds an intermediary

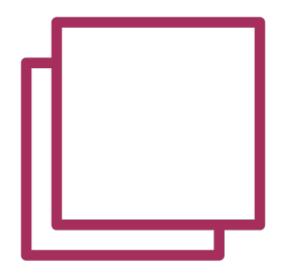

Presentation-friendly
layer over data
Known as the ViewModel

Using Model-View-ViewModel

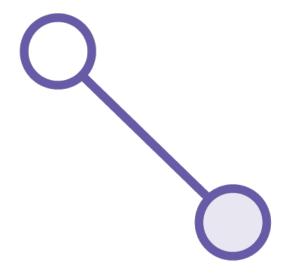

MVVM with Xamarin.Forms

ViewModel classes

Provide presentationfriendly layer over data

BaseViewModel class

Serves as base to ViewModel classes Includes code to simplify common MVVM tasks

Xamarin.Forms services

Framework features that handle common management and interaction tasks

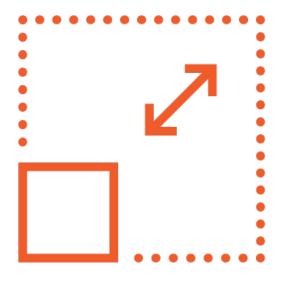

Providing Complete Data Binding Support

Target reads value from source

Value changes

Target does not detect a change in the source

Change notification

Source must notify target of change Target can then reread value

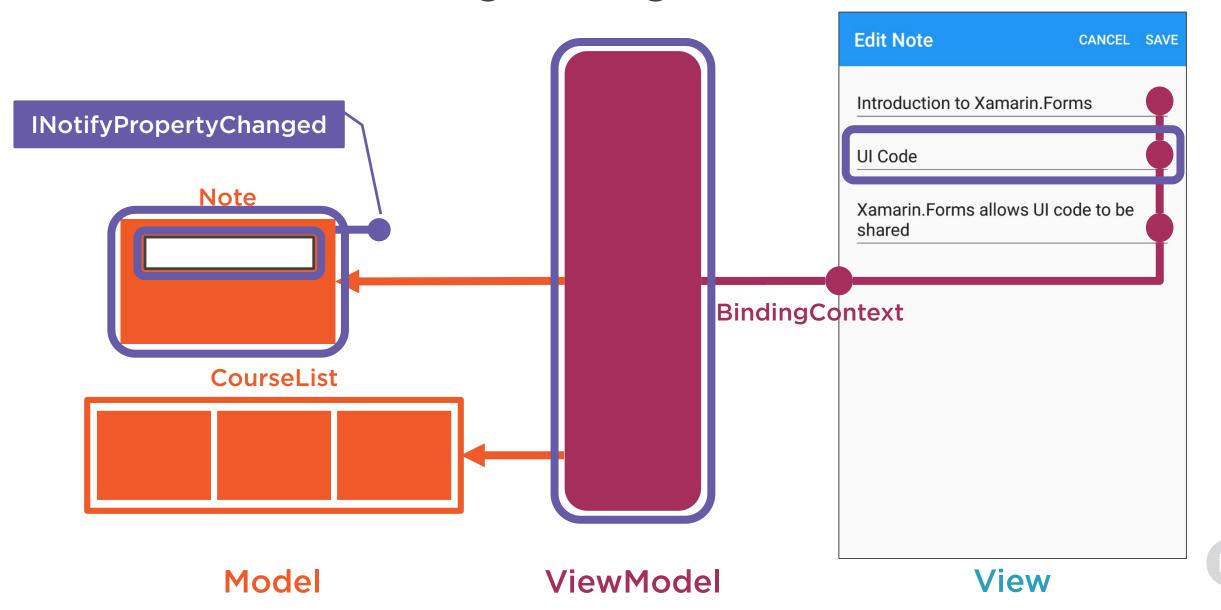

Change Notification

Providing value change notification

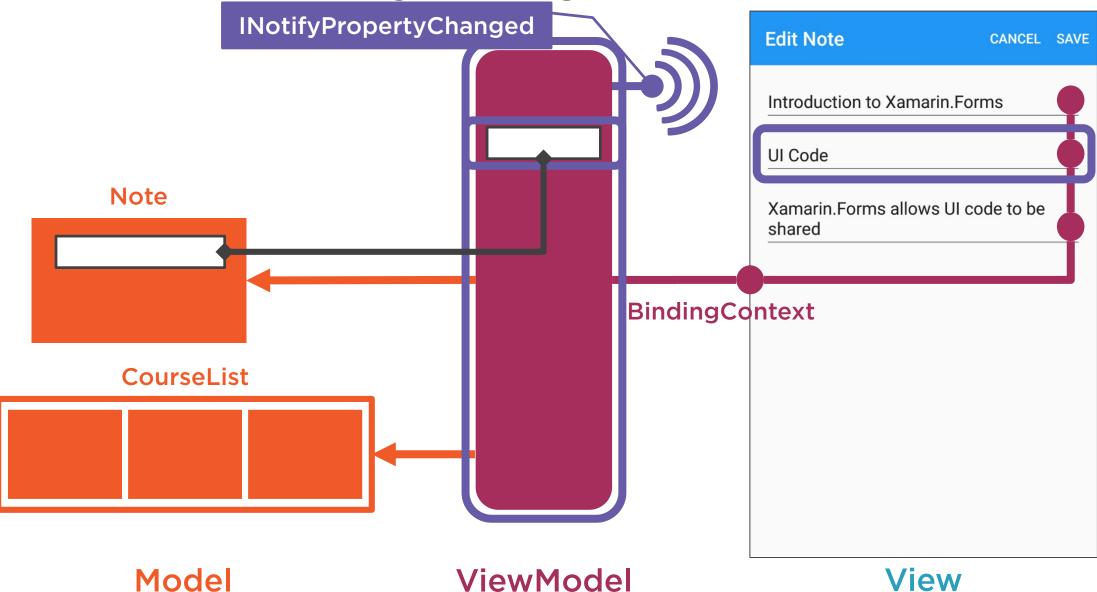

- Implement INotifyPropertyChanged
- Fire PropertyChanged event when value changed

Providing Change Notification

Providing Change Notification

Summary

Model-View-ViewModel

- Architectural pattern
- Decouples data from presentation

Summary

View

- User presentation

Model

- Data representation

ViewModel

- Intermediary between view and model
- Provides presentation-friendly layer over the data representation

Summary

ViewModel properties

- Provide data binding support
- Provide value change notifications

BaseViewModel class

- Generated by Visual Studio
- Base class of ViewModel classes
- Implements INotifyPropertyChanged
- Includes code to simplify change notifications
